

# Security System Administration

## Software

Secured State Administration software puts the owner in control with the ability to easily monitor and customize their security system.

### Simple to Operate

Security system changes and refinements are easily made (without programming) using the same graphical interface as the Security Control software. Icons can be relocated simply by dragging the mouse.

Icon captions, graphics, sounds, annunciated messages, recorded states and event priorities are all easily reviewed and modified from tabular grids.

Preventive maintenance reports are easily filtered to include only those devices exceeding a maximum number of operations. Operation counts are recorded for every device.

Extensive interactive help files are available whenever necessary.

Date	Time	Console	Operator	Event	Description	Location
04/18/02	13:12:50	Port B		Program Started		
04/18/02	13:12:52	F		Device Timing		
04/18/02	13:12:59	F		Door Timing		
04/18/02	13:27:00	F

### Powerful to Use

Custom reports can be defined by grouping, sorting and filtering historical data. Custom report configurations can be saved and reused. To control the amount of data generated, recording can be defined per event or device. All data is stored in an encrypted format and is read-only. Data can be archived to removable storage and then retrieved as necessary.

Door lock dwell times, DPS chatter delay times, and 'Open Too Long' alarm times can all be defined per device. 'Time zones' for door unlock and alarm shunting can be configured as required.

User names and passwords can be created. For accountability, permissions can be delegated to all operations of both the Security Control and Administration programs.

For a full specification, contact Creative Technologies or your local representative.
